PL SNB FX Reserves Z

V-B rework of prior version. Persona: SF-E1 + PL-E1.

David Stendahl · Market Lab Analytics · November 6, 2026

What this signal is

V-B rework of prior version. Persona: SF-E1 + PL-E1.

The composite is bounded between minus one and plus one through tanh. On 2010-05-04 it reached its series maximum plus 1.000 and on 2005-07-05 its series minimum minus 0.999.

Today the composite reads near +0.74. See live page for current state.

• • •

How the inputs compose

V-B rework of prior version. Persona: SF-E1 + PL-E1.

The engine also computes four confirming features: five-day velocity, 60-day volatility regime, 60-day correlation with platinum returns, 63-day lag-1 autocorrelation.

• • •

What the state-conditional returns have actually done

The platinum forward-60-day return baseline (unconditional) is mean plus 1.30 percent, median plus 1.47 percent.

> **Reference baseline (6,721 platinum-aligned forward-60-day windows over the live engine window)**
>
> Platinum forward-60-day return baseline: mean plus 1.30 percent, median plus 1.47 percent. Phase 0 source: Z101153 engine parquet joined with NYMEX platinum back-adjusted continuous closes.

SNB reserves accumulating (Phase +1), 2,095 trading days, returned on average plus 3.22 percent.

Normal (Phase +0), 3,934 trading days, returned on average plus 0.30 percent.

SNB reserves draining (Phase −1), 2,931 trading days, returned on average plus 0.32 percent.

• • •

Three cases that frame how to read the signal

Case 1: 2010-05 composite series maximum

On 2010-05-04 the composite reached its series maximum plus 1.000. Platinum subsequent 60-day behavior aligned with the snb reserves accumulating regime pattern.

Case 2: 2005-07 composite series minimum

On 2005-07-05 the composite reached its series minimum minus 0.999. Platinum subsequent 60-day behavior aligned with the snb reserves draining regime pattern.

Case 3: March 2020 COVID shock window

The March 2020 COVID liquidity shock drove violent regime shifts across platinum drivers. The composite oscillated as the underlying mechanism repriced.

• • •

How to use the signal today

This is a regime detector on a 60-day forward horizon.

Three best uses. First, as a regime filter for platinum exposure (Phase +1 equals snb reserves accumulating). Second, as a cross-check against positioning and price-momentum signals. Third, as a transition-window warning, pairing with price-based signals for conviction.

• • •

Methodology notes

V-B rework of prior version. Persona: SF-E1 + PL-E1.

The 1990 start reflects the earliest reliable source coverage.

• • •

What this signal does not cover

Four caveats. The signal is a regime detector, not a timing signal. State-conditional means hold on average, not for every individual window. Regime persistence varies with macroeconomic backdrop. Individual windows can run much longer or shorter than mean sample. State-conditional edges are backward-looking empirical averages. Future regimes may differ. The baseline is NYMEX platinum back-adjusted continuous (PL_1240BD).

Not investment advice. Signal readings and empirical statistics are derived from publicly available data sources. (c) 2026 David Stendahl.
