What this signal is

GSR direction/level is heavily saturated in the estate (Y11721+Z4354+Z6909). SI-Z07 exploits the orthogonal statistic . asymmetry of GSR change distribution. Right-skewed changes = right-tail GSR spikes = SI crashes faster than GC (crisis mode). Melek TDS canonical GSR-fair-value framework.

The composite is bounded between minus one and plus one through tanh. On 2015-04-21 it reached its series maximum plus 1.000 and on 2025-04-04 its series minimum minus 1.000.

Today the composite reads near −0.51. See live page for current state.

How the inputs compose

GSR direction/level is heavily saturated in the estate (Y11721+Z4354+Z6909). SI-Z07 exploits the orthogonal statistic . asymmetry of GSR change distribution. Right-skewed changes = right-tail GSR spikes = SI crashes faster than GC (crisis mode). Melek TDS canonical GSR-fair-value framework.

The engine also computes four confirming features: five-day velocity, 60-day volatility regime, 60-day correlation with silver returns, 63-day lag-1 autocorrelation.

• • •

What the state-conditional returns have actually done

The silver forward-60-day return baseline (unconditional) is mean plus 1.02 percent, median minus 0.15 percent.

> **Reference baseline (9,216 silver-aligned forward-60-day windows over the live engine window)**
>
> Silver forward-60-day return baseline: mean plus 1.02 percent, median minus 0.15 percent. Phase 0 source: Z102097 engine parquet joined with COMEX silver back-adjusted continuous closes.

GSR skew positive (Phase +1), 3,718 trading days, returned on average plus 0.60 percent.

Normal (Phase +0), 1,870 trading days, returned on average plus 0.69 percent.

GSR skew negative (Phase −1), 3,628 trading days, returned on average plus 1.63 percent.

• • •

Three cases that frame how to read the signal

Case 1: 2015-04 composite series maximum

On 2015-04-21 the composite reached its series maximum plus 1.000. Silver subsequent 60-day behavior aligned with the gsr skew positive regime pattern.

Case 2: 2025-04 composite series minimum

On 2025-04-04 the composite reached its series minimum minus 1.000. Silver subsequent 60-day behavior aligned with the gsr skew negative regime pattern.

Case 3: March 2020 COVID shock window

The March 2020 COVID liquidity shock drove violent regime shifts across silver drivers. The composite oscillated as the underlying mechanism repriced.

• • •

How to use the signal today

This is a regime detector on a 60-day forward horizon.

Three best uses. First, as a regime filter for silver exposure (Phase +1 equals gsr skew positive). Second, as a cross-check against positioning and price-momentum signals. Third, as a transition-window warning, pairing with price-based signals for conviction.

• • •

Methodology notes

GSR direction/level is heavily saturated in the estate (Y11721+Z4354+Z6909). SI-Z07 exploits the orthogonal statistic . asymmetry of GSR change distribution. Right-skewed changes = right-tail GSR spikes = SI crashes faster than GC (crisis mode). Melek TDS canonical GSR-fair-value framework.

The 1989 start reflects the earliest reliable source coverage.

• • •

What this signal does not cover

Four caveats. The signal is a regime detector, not a timing signal. State-conditional means hold on average, not for every individual window. Regime persistence varies with macroeconomic backdrop. Individual windows can run much longer or shorter than mean sample. State-conditional edges are backward-looking empirical averages. Future regimes may differ. The baseline is COMEX silver back-adjusted continuous (SI_1240BD).

Not investment advice. Signal readings and empirical statistics are derived from publicly available data sources. (c) 2026 David Stendahl.
