PA WPIC PT Deficit Cross-Read Z

PA byproduct of PT mining - PT tight = same refinery constraints = bullish PA.

David Stendahl · Market Lab Analytics · November 6, 2026

What this signal is

PA byproduct of PT mining - PT tight = same refinery constraints = bullish PA.

The composite is bounded between minus one and plus one through tanh. On 2017-01-04 it reached its series maximum plus 1.000 and on 2018-01-03 its series minimum minus 1.000.

Today the composite reads near +0.61. See live page for current state.

• • •

How the inputs compose

PA byproduct of PT mining - PT tight = same refinery constraints = bullish PA.

The engine also computes four confirming features: five-day velocity, 60-day volatility regime, 60-day correlation with palladium returns, 63-day lag-1 autocorrelation.

• • •

What the state-conditional returns have actually done

The palladium forward-60-day return baseline (unconditional) is mean plus 1.56 percent, median plus 1.62 percent.

> **Reference baseline (2,415 palladium-aligned forward-60-day windows over the live engine window)**
>
> Palladium forward-60-day return baseline: mean plus 1.56 percent, median plus 1.62 percent. Phase 0 source: Z102116 engine parquet joined with NYMEX palladium back-adjusted continuous closes.

Platinum deficit cross-read bullish (Phase +1), 1,412 trading days, returned on average plus 2.58 percent.

Normal (Phase +0), 5,788 trading days, returned on average plus 1.39 percent.

Platinum deficit cross-read bearish (Phase −1), 1,005 trading days, returned on average plus 0.11 percent.

• • •

Three cases that frame how to read the signal

Case 1: 2017-01 composite series maximum

On 2017-01-04 the composite reached its series maximum plus 1.000. Palladium subsequent 60-day behavior aligned with the platinum deficit cross-read bullish regime pattern.

Case 2: 2018-01 composite series minimum

On 2018-01-03 the composite reached its series minimum minus 1.000. Palladium subsequent 60-day behavior aligned with the platinum deficit cross-read bearish regime pattern.

Case 3: March 2020 COVID shock window

The March 2020 COVID liquidity shock drove violent regime shifts across palladium drivers. The composite oscillated as the underlying mechanism repriced.

• • •

How to use the signal today

This is a regime detector on a 60-day forward horizon.

Three best uses. First, as a regime filter for palladium exposure (Phase +1 equals platinum deficit cross-read bullish). Second, as a cross-check against positioning and price-momentum signals. Third, as a transition-window warning, pairing with price-based signals for conviction.

• • •

Methodology notes

PA byproduct of PT mining - PT tight = same refinery constraints = bullish PA.

The 1993 start reflects the earliest reliable source coverage.

• • •

What this signal does not cover

Four caveats. The signal is a regime detector, not a timing signal. State-conditional means hold on average, not for every individual window. Regime persistence varies with macroeconomic backdrop. Individual windows can run much longer or shorter than mean sample. State-conditional edges are backward-looking empirical averages. Future regimes may differ. The baseline is NYMEX palladium back-adjusted continuous (PA_1240BD).

Not investment advice. Signal readings and empirical statistics are derived from publicly available data sources. (c) 2026 David Stendahl.
