GC GDXJ-GDX Ratio Z

Junior miners are the highest-beta gold plays with the most operating leverage and financing risk. In normal markets they trade at a discount to seniors.

David Stendahl · Market Lab Analytics · November 6, 2026

What this signal is

Junior miners are the highest-beta gold plays with the most operating leverage and financing risk. In normal markets they trade at a discount to seniors. When GDXJ outperforms GDX, speculative and retail money is piling into leveraged gold plays - a classic euphoric gold-bull confirmation. Different than a sibling signal (miners-vs-metal): this measures RISK APPETITE within the miner complex. Regime-selective by construction - juniors either rip in bull moves or get left behind.

The composite is bounded between minus one and plus one through tanh. On 2010-11-09 it reached its series maximum plus 0.999 and on 2020-03-17 its series minimum minus 0.999.

Today the composite reads near −0.57. See live page for current state.

How the inputs compose

Junior miners are the highest-beta gold plays with the most operating leverage and financing risk. In normal markets they trade at a discount to seniors. When GDXJ outperforms GDX, speculative and retail money is piling into leveraged gold plays - a classic euphoric gold-bull confirmation. Different than a sibling signal (miners-vs-metal): this measures RISK APPETITE within the miner complex. Regime-selective by construction - juniors either rip in bull moves or get left behind.

The engine also computes four confirming features: five-day velocity, 60-day volatility regime, 60-day correlation with gold returns, 63-day lag-1 autocorrelation.

• • •

What the state-conditional returns have actually done

The gold forward-60-day return baseline (unconditional) is mean plus 1.25 percent, median plus 0.91 percent.

> **Reference baseline (4,131 gold-aligned forward-60-day windows over the live engine window)**
>
> Gold forward-60-day return baseline: mean plus 1.25 percent, median plus 0.91 percent. Phase 0 source: Z11112 engine parquet joined with COMEX gold back-adjusted continuous closes.

Juniors leading majors (Phase +1), 984 trading days, returned on average plus 2.77 percent.

Normal (Phase +0), 5,452 trading days, returned on average plus 0.44 percent.

Juniors lagging majors (Phase −1), 2,529 trading days, returned on average plus 0.74 percent.

• • •

Three cases that frame how to read the signal

Case 1: 2010-11 composite series maximum

On 2010-11-09 the composite reached its series maximum plus 0.999. Gold subsequent 60-day behavior aligned with the juniors leading majors regime pattern.

Case 2: 2020-03 composite series minimum

On 2020-03-17 the composite reached its series minimum minus 0.999. Gold subsequent 60-day behavior aligned with the juniors lagging majors regime pattern.

Case 3: March 2020 COVID shock window

The March 2020 COVID liquidity shock drove violent regime shifts across gold drivers. The composite oscillated as the underlying mechanism repriced.

• • •

How to use the signal today

This is a regime detector on a 60-day forward horizon.

Three best uses. First, as a regime filter for gold exposure (Phase +1 equals juniors leading majors). Second, as a cross-check against positioning and price-momentum signals. Third, as a transition-window warning, pairing with price-based signals for conviction.

• • •

Methodology notes

Junior miners are the highest-beta gold plays with the most operating leverage and financing risk. In normal markets they trade at a discount to seniors. When GDXJ outperforms GDX, speculative and retail money is piling into leveraged gold plays - a classic euphoric gold-bull confirmation. Different than a sibling signal (miners-vs-metal): this measures RISK APPETITE within the miner complex. Regime-selective by construction - juniors either rip in bull moves or get left behind.

The 1990 start reflects the earliest reliable source coverage.

• • •

What this signal does not cover

Four caveats. The signal is a regime detector, not a timing signal. State-conditional means hold on average, not for every individual window. Regime persistence varies with macroeconomic backdrop. Individual windows can run much longer or shorter than mean sample. State-conditional edges are backward-looking empirical averages. Future regimes may differ. The baseline is COMEX gold back-adjusted continuous (GC_1240BD).

Not investment advice. Signal readings and empirical statistics are derived from publicly available data sources. (c) 2026 David Stendahl.
