What this signal is

Prediction-market insider flow historically precedes major geopolitical shocks. Gold is the classic flight-to-safety receiver. CB reserve accumulation + retail safe-haven demand both accelerate on war-imminence signals. Independent alpha channel from VX vol expansion.

The composite is bounded between minus one and plus one through tanh. On 2026-06-16 it reached its series maximum plus 0.732 and on 2026-08-28 its series minimum minus 0.713.

Today the composite reads near +0.06. See live page for current state.

• • •

How the inputs compose

Prediction-market insider flow historically precedes major geopolitical shocks. Gold is the classic flight-to-safety receiver. CB reserve accumulation + retail safe-haven demand both accelerate on war-imminence signals. Independent alpha channel from VX vol expansion.

The engine also computes four confirming features: five-day velocity, 60-day volatility regime, 60-day correlation with gold returns, 63-day lag-1 autocorrelation.

• • •

What the state-conditional returns have actually done

The gold forward-60-day return baseline (unconditional) is mean plus 0.19 percent, median plus 0.15 percent.

> **Reference baseline (53 gold-aligned forward-60-day windows over the live engine window)**
>
> Gold forward-60-day return baseline: mean plus 0.19 percent, median plus 0.15 percent. Phase 0 source: Z12001 engine parquet joined with COMEX gold back-adjusted continuous closes.

Insider accumulation flow (Phase +1), 7 trading days, returned on average plus 2.64 percent.

Normal (Phase +0), 9,432 trading days, returned on average plus 0.71 percent.

• • •

Three cases that frame how to read the signal

Case 1: 2026-06 composite series maximum

On 2026-06-16 the composite reached its series maximum plus 0.732. Gold subsequent 60-day behavior aligned with the insider accumulation flow regime pattern.

Case 2: 2026-08 composite series minimum

On 2026-08-28 the composite reached its series minimum minus 0.713. Gold subsequent 60-day behavior aligned with the insider distribution flow regime pattern.

Case 3: March 2020 COVID shock window

The March 2020 COVID liquidity shock drove violent regime shifts across gold drivers. The composite oscillated as the underlying mechanism repriced.

• • •

How to use the signal today

This is a regime detector on a 60-day forward horizon.

Three best uses. First, as a regime filter for gold exposure (Phase +1 equals insider accumulation flow). Second, as a cross-check against positioning and price-momentum signals. Third, as a transition-window warning, pairing with price-based signals for conviction.

• • •

Methodology notes

Prediction-market insider flow historically precedes major geopolitical shocks. Gold is the classic flight-to-safety receiver. CB reserve accumulation + retail safe-haven demand both accelerate on war-imminence signals. Independent alpha channel from VX vol expansion.

The 1989 start reflects the earliest reliable source coverage.

What this signal does not cover

Four caveats. The signal is a regime detector, not a timing signal. State-conditional means hold on average, not for every individual window. Regime persistence varies with macroeconomic backdrop. Individual windows can run much longer or shorter than mean sample. State-conditional edges are backward-looking empirical averages. Future regimes may differ. The baseline is COMEX gold back-adjusted continuous (GC_1240BD).

Not investment advice. Signal readings and empirical statistics are derived from publicly available data sources. (c) 2026 David Stendahl.
