PL Wavelet Coherence Inflation Breakeven

The PL Wavelet Coherence Inflation Breakeven signal captures a distinct platinum market regime driven by its underlying mechanism; the engine produces a tanh-bounded composite between minus one and plus one.

What this signal is

The PL Wavelet Coherence Inflation Breakeven signal captures a distinct platinum market regime driven by its underlying mechanism; the engine produces a tanh-bounded composite between minus one and plus one.

The composite is bounded between minus one and plus one through tanh. On 2021-12-27 it reached its series maximum plus 0.999 and on 2025-07-02 its series minimum minus 0.999.

Today the composite reads near −0.98. See live page for current state.

• • •

How the inputs compose

The PL Wavelet Coherence Inflation Breakeven signal captures a distinct platinum market regime driven by its underlying mechanism; the engine produces a tanh-bounded composite between minus one and plus one.

The engine also computes four confirming features: five-day velocity, 60-day volatility regime, 60-day correlation with platinum returns, 63-day lag-1 autocorrelation.

• • •

What the state-conditional returns have actually done

The platinum forward-60-day return baseline (unconditional) is mean plus 1.06 percent, median plus 1.05 percent.

> **Reference baseline (5,928 platinum-aligned forward-60-day windows over the live engine window)**

> Platinum forward-60-day return baseline: mean plus 1.06 percent, median plus 1.05 percent. Phase 0 source: Z5640 engine parquet joined with NYMEX platinum back-adjusted continuous closes.

Inflation coupling strong (Phase +1), 3,045 trading days, returned on average plus 1.88 percent.

Normal (Phase +0), 2,438 trading days, returned on average plus 0.48 percent.

Inflation coupling weak (Phase −1), 2,149 trading days, returned on average plus 1.03 percent.

• • •

Three cases that frame how to read the signal

Case 1: 2021-12 composite series maximum

On 2021-12-27 the composite reached its series maximum plus 0.999. Platinum subsequent 60-day behavior aligned with the inflation coupling strong regime pattern.

Case 2: 2025-07 composite series minimum

On 2025-07-02 the composite reached its series minimum minus 0.999. Platinum subsequent 60-day behavior aligned with the inflation coupling weak regime pattern.

Case 3: March 2020 COVID shock window

The March 2020 COVID liquidity shock drove violent regime shifts across platinum drivers. The composite oscillated as the underlying mechanism repriced.

• • •

How to use the signal today

This is a regime detector on a 60-day forward horizon.

Three best uses. First, as a regime filter for platinum exposure (Phase +1 equals inflation coupling strong). Second, as a cross-check against positioning and price-momentum signals. Third, as a transition-window warning, pairing with price-based signals for conviction.

• • •

Methodology notes

The PL Wavelet Coherence Inflation Breakeven signal captures a distinct platinum market regime driven by its underlying mechanism; the engine produces a tanh-bounded composite between minus one and plus one.

The 1996 start reflects the earliest reliable source coverage.

• • •

What this signal does not cover

Four caveats. The signal is a regime detector, not a timing signal. State-conditional means hold on average, not for every individual window. Regime persistence varies with macroeconomic backdrop. Individual windows can run much longer or shorter than mean sample. State-conditional edges are

backward-looking empirical averages. Future regimes may differ. The baseline is NYMEX platinum back-adjusted continuous (PL_1240BD).

Not investment advice. Signal readings and empirical statistics are derived from publicly available data sources. (c) 2026 David Stendahl.
